

## 1. Flight query and selection function test

This integration test simulates a complete flight booking process for a user. The test includes logging in, searching for flights, viewing flight details, submitting passenger information, processing payment, and finally verifying the booking in the user's booking history. It aims to ensure that each part of the booking flow works as expected in a real-life scenario.

## 2. User Registration and Search Integration Test

This test verifies user registration, login, flight search, and logout. It ensures that a unique user can register successfully, log in with valid credentials, search for flights with specified departure and destination cities, and log out, redirecting to a page with "Login / Sign up" options.

## 3. User Booking Seat after Buy ticket

This test tests whether a user can log in to their account to view the history of ticket purchase and enter the corresponding seat selection interface to select and confirm the seat, and whether the ticket and all the corresponding information will be displayed after the confirmation.

The test results are:

```
(.venv) PS C:\Projects\Group-6-FS\Flight_booking> python integration_test.py
>>
...
-----
Ran 3 tests in 5.355s
OK
```

How to run:

1. First ensure Python 3.x is installed on your system.
2. Install Required Libraries, use `pip install flask unittest supabase flask-testing`
3. Run the integration test by `python integration_test.py`
